

## Run-a-Splice®

Ricoh's **Run-a-Splice®** is an exciting new innovation that should enable you to realize substantial cost savings through the increased efficiency in your converting operation.

**Run-a-Splice®** is a revolutionary thermal splicing system that allows you to print and die cut on your label press without having to re-splice the rolls while still providing you with high quality usable thermal labels for variable information printing.

This unique splice construction combines a base thermal paper identical to the rest of the roll with a clear printable tape. With **Run-a-Splice®** you can produce a high quality label without the need to slow the press for an approaching splice or perform costly rework of the rolls.

### Four Ways To Save!

- Maintain Press Speed while Running and Printing through the Splice. Now there is no need to reduce speed to hold registration and prevent splice breaks.
- No Lost Material due to Re-Splicing and Re-Working rolls
- No Lost Labor to Rewind Rolls and Re-Splice
- Faster Press Speeds + Reduced Labor & Waste Costs = **\$\$ Savings for YOU!**  
Our test analysis has shown a possible savings of \$0.005 to \$0.015 per MSI.

Look for the **Run-a-Splice®** label on our laminated paper products.
